PROJECT DESCRIPTION:

Remediation of Oil Contaminated Soil

PROJECT LOCATION:

4814 American Rd.

Rockford, IL

PROJECT DATES:

August 23-26, 1988

DO TI ES

AS CONTRACTED:

o Excavation of contaminated soil

o Soil sampling

o Consolidating drummed oil sludge for

disposal

o Documentation report
o Bulk transportation and
disposal arrangements

o Backfilling excavated areas with clean

gravel/topsoil

Robert Murray, Environmental Specialist

EXCAVATOR:

Northern Illinois Service Co.

Rockford, Illinois

SPECIAL WASTE

BULK TRANSPORTER:

Will's Trucking, Richfield, Ohio Fort Transfer, Morton, Illinois

Liberty Transportation, Morton, Illinois

Page 1

I. BACKGROUND

On August 9, 1988, FIW, Inc. was contracted by Robert Johnston of Camcar Textron to perform an oil contamination remedial action project at the Rockford Headed Products Div.'s facility located at 4814 American Rd. in Rockford, Illinois. FIW's duties as contracted were as follows:

- the excavation of approximately 350 cubic yards of non-RCRA regulated oil contaminated soil located at the facility
- emptying approximately 45 drums of oil sludge and consolidating it with the contaminated soil for disposal
- transporting and disposing of the contaminated soil
- backfilling and compacting excavated areas
- soil sampling
- final documentation report

The areas of contamination and excavation are indicated on the site diagrams included with this report as Exhibit I.

Photo documentation of this project is included with this report as Exhibit II.

II. EXCAVATION

The project began on August 23, 1988 with the excavation of the North Trench. Excavation proceeded north along the garage for approximately 22 feet before contamination was no longer observed. The contamination tapered back to just along the black top as excavation continued to the west, where the trench width decreased to 5 feet. Excavated depths in this area varied between 2.25 and 2.75 feet.

The South Trench which ran along the north side of the building showed considerable contamination at the east end. Excavation had to proceed to a depth of 3.5 feet in the square area which bordered the facility's main building and which extended east approximately 15 feet as indicated on the site diagram. Contamination west of this area was more limited to the surface and depths of excavation tapered off to approximately 1.75 feet just east of the transformer. The area west of the transformer showed minimal contamination and only 8 inches of surface soil was removed there.

The East Trench showed considerable surface contamination at the north end and excavation proceeded eastward in this area 11-15 feet. The contamination, however, became less apparent as excavation proceeded south, and the width of excavation therefore tapered down to 3 feet in this area. Excavation depths in the East Trench were fairly uniform at approximately 2 feet.

The site diagram (see Exhibit I) indicates excavated areas and depths at the nine sampling locations.

III. SLUDGE DRUM PROCESSING

The oil sludge and absorbent drums were consolidated on site in a waste pile prior to shipment. This was accomplished by lining the blacktop drive in front of the garage with plastic sheeting and depositing oil contaminated soil from the excavated areas on the plastic, to act as absorbant for the free liquids that were present in the sludge drums. These drums were then emptied individually into the pile by using a forklift equipped with a drum tilt. The oil sludge was combined with additional soil to aid in stabilization prior to loading onto the dump trucks with the rest of the excavated oil contaminated soil for shipment.

IV. SAMPLING

The objective for this remedial action project was to remove all oil contaminated soil in the designated areas, with an excavation protocol based on sight. With the visible contamination removed, clean-up documentation was performed by analyzing for oil and grease.

Prior to excavation, a surface composite of contaminated soil from the North Trench was analyzed as a reference for existing contamination levels. Also analyzed were two samples from presumed uncontaminated areas directly north of the North Trench and in the field east of the East Trench. The analysis performed on these two samples would be used to document background levels in the presumed clean areas surrounding the site. Table I lists the 12 sampling locations and indicates the levels of oil and grease as analyzed.

The codes for each sample location are included for cross reference with the site diagram, where each of the sample locations and their corresponding depth of excavation are indicated. Also analyzed were composite samples prepared for each trench. An EP Toxicity Test was performed on each composite sample for Barium, Cadmium, Chromium, Lead and Mercury. Table II indicates the results of the tests, all of which were insignificant.

The nine trench samples, three composite samples and the North Trench contaminated reference sample were obtained by Robert Murray of FIW, and were relinquished to Robert Johnston of Camcar Textron. Exhibit III contains the analytical reports and chain of custody form for the samples analyzed.

V. TRANSPORTATION AND DISPOSAL

Approximately 297 cubic yards of oil contaminated soil and sludge was removed in 20 loads as a result of this project. All material was deposited in Waste Management's CID Landfill located in Calumet City, Illinois. Table III lists the loads in order of shipment, indicates their loaded weight/volume, and lists their departure and arrival dates at the facility. Exhibit IV contains the manifests used for each load.

Upon the removal of all excavated soil and sludge, the trenches were backfilled with clean fill, compacted and the site was swept clean.

Robert L. Murray, Environmental Specialist
